 CARE 2024 Climate Adaptation and
Resilience Conference

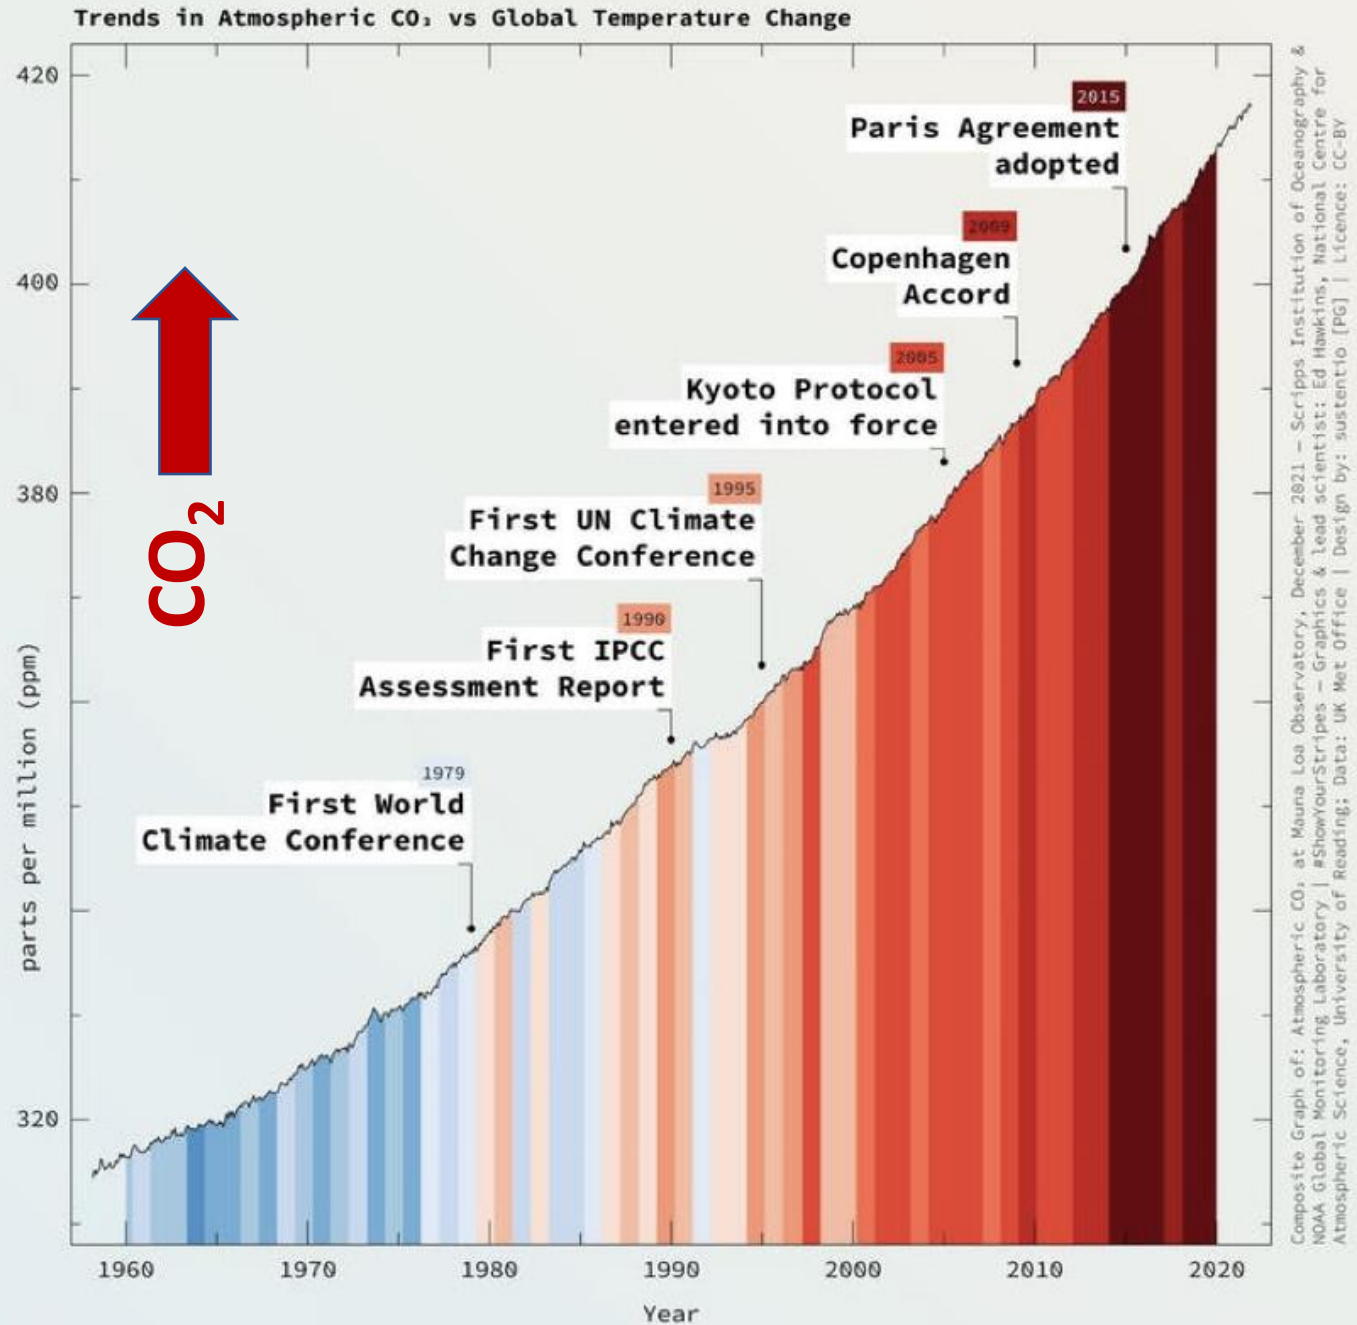

BRACING FUTURE HEAT

A Reality Check on Heat Risks and Preparedness

5 December 2024 | The Millennity, Kwun Tong

October 2024 was **1.65°C** above the **pre-industrial level** and was the 15th month in a 16-month period for which the global-average surface air temperature exceeded 1.5°C above pre-industrial levels

2024 on track to be warmest year and first year above 1.5°C

Annual global temperature anomalies relative to pre-industrial (1850–1900)

Data: ERA5 (1940–2024) • Credit: C3S/ECMWF

* Provisional estimate for 2024 based on 10 months (January to October)

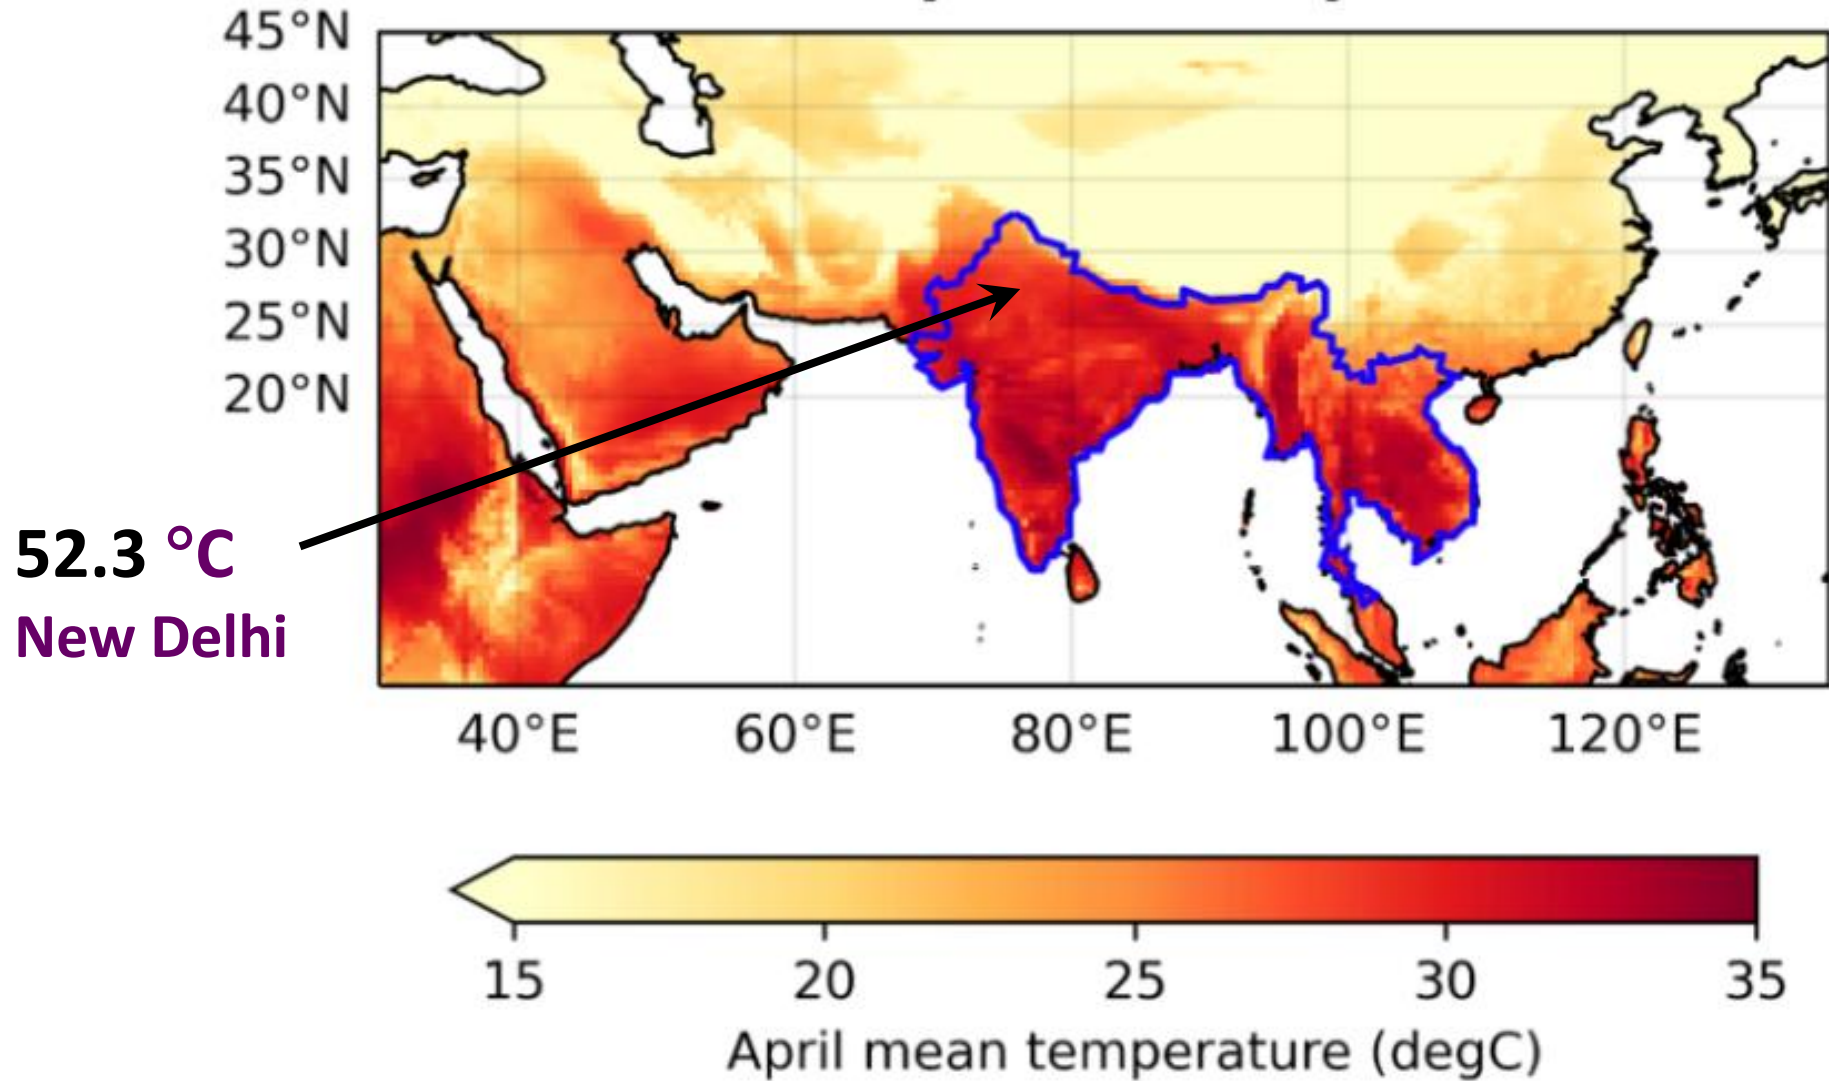

PROGRAMME OF THE
EUROPEAN UNION

Asian Heat 2024

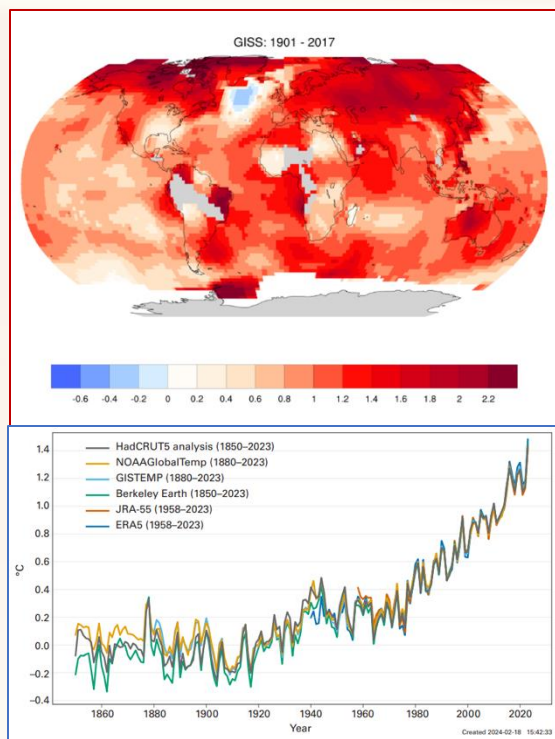

Mean temperature: April-2024

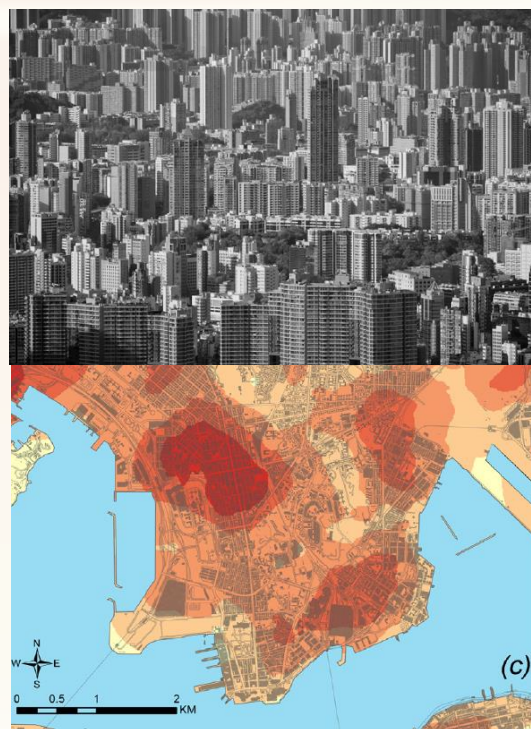

Warming in Hong Kong

Attributing to **global warming** and **local urbanization**, there is a significant warming trend over the last century.

Global warming

Local urbanization

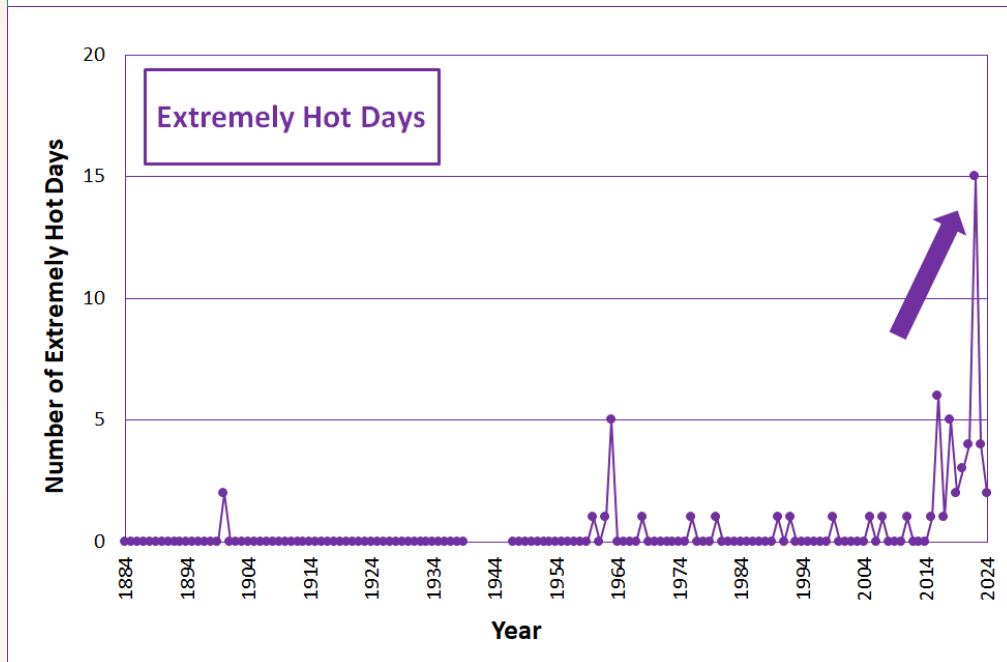

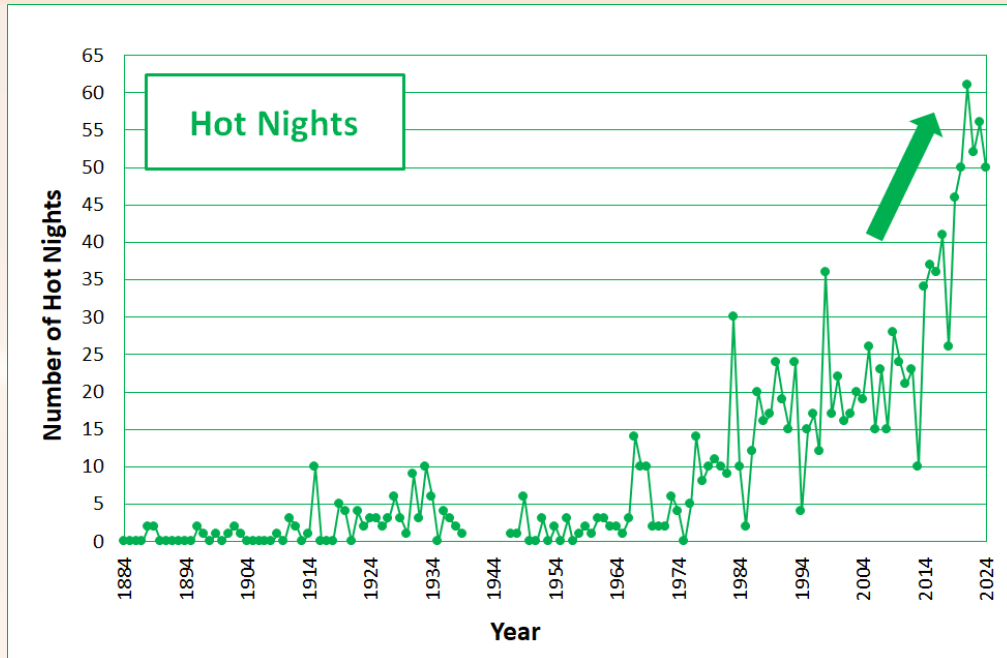

Annual mean temperature recorded at the Hong Kong Observatory Headquarters (1885-2023).

Hottest days in Hong Kong

Date	HKOHq Max. Temperature (°C)	Remark
22 Aug 2017	36.6	Super Typhoon Hato
8 Aug 2015	36.3	Severe typhoon Soudelor
27 July 2023	36.1	Super Typhoon Doksuri
24 July 2022	36.1	Subtropical ridge
23 May 2021	36.1	Subtropical ridge
18 Aug 1990	36.1	Typhoon Yancy
19 Aug 1900	36.1	Tropical cyclone to the SE of Hong Kong
.....		
17 Sep 2024	35.7	Tropical cyclone to the SE of Hong Kong

Extremely High Temperatures in Hong Kong

	Hot Nights	Very Hot Days	Extremely Hot Days
1885-1914 (30-year average)	0.6	2.2	0.07
1995-2024 (30-year average)	28.8 (↑ 48 times)	23.2 (↑ 11 times)	1.6 (↑ 23 times)

In 2022, there were 15 extremely hot days (daily maximum temperature at HKOHq ≥ 35.0 °C), the highest since records began in 1884.

Hot nights - days with a minimum temperature of 28°C or above
 Very hot days - days with a maximum temperature of 33°C or above
 Cold days - days with a minimum temperature of 12°C or below

Climate projections for Hong Kong

IPCC AR6 Shared Socioeconomic Pathways

Global Climate Models from CMIP6

Statistical Downscaling Ongoing

Including changes in annual rainfall, annual maximum daily rainfall, mean sea level, annual mean temperature, number of hot days, hot nights and cold days.

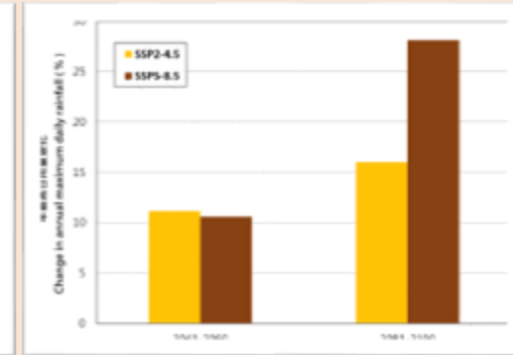

Dynamical Downscaling (under development)

Compute **sub-daily rainfall and other elements such as solar radiation** over HK and nearby region by adopting regional climate models, such as RegCM from ICTP, co-work with WCRP CORDEX project.

Key Projected Trends

- Increases in mean temperatures and annual rainfall
- More extreme temperature and rainfall events
- Mean sea level continues to rise

IPCC AR6: Intergovernmental Panel on Climate Change Sixth Assessment Report

CMIP6: Coupled Model Intercomparison Project Phase 6

CORDEX: Coordinated Regional Climate Downscaling Experiment

WCRP: World Climate Research Programme

ICTP: International Centre for Theoretical Physics

RegCM: Regional Climate Model

Peak warming over the twenty-first century (°C) relative to pre-industrial levels

Scenarios ● 50% chance ● 66% chance ● 90% chance

Likelihood of warming exceeding a specific temperature limit (%)

Climate Projections of Hong Kong (IPCC AR6)

Increase in Annual Mean Temperature

Relative to 1995-2014 (23.4°C, at HKO), the annual mean temperature in Hong Kong in 2081-2100 is projected to increase by about 2.0°C and 3.6°C respectively under the intermediate (SSP2-4.5) and very high (SSP5-8.5) emissions scenarios.

Annual mean temperature of Hong Kong relative to the average of 1995-2014 under the intermediate (SSP2-4.5) and very high (SSP5-8.5) emissions scenarios

https://www.hko.gov.hk/en/climate_change/proj_hk_temp_mean.htm

More Extreme Temperatures

The annual number of hot nights and very hot days in Hong Kong are expected to increase significantly in the 21st century, while the annual number of cold days is expected to drop.

在非常高温室氣體排放情景 (SSP5-8.5) 下，香港每年熱夜數目、酷熱日數和寒冷日數的未來推算
Projected annual number of hot nights, very hot days and cold days in Hong Kong under very high greenhouse gas emissions scenario (SSP5-8.5)

Hong Kong Heat Index (HKHI)

HKO and the Chinese University of Hong Kong (CUHK) jointly developed the [Hong Kong Heat Index \(HKHI\)](#) for use in the hot and humid sub-tropical climate in Hong Kong to enhance the heat stress information services using the hospitalization data and different measurement data from the HKO in-house developed "[Heat Stress Monitoring System](#)".

Hong Kong Heat Index (HKHI):

$$\text{HKHI} = 0.8 \text{ Tnw} + 0.05 \text{ Tg} + 0.15 \text{ Ta}$$

Natural Wet-Bulb Temperature (Tnw) Globe Temperature (Tg) Air Temperature (Ta)

[Excess hospitalization ratio](#) with different percentiles of daily maximum HKHI

Heat related advisory, alerts and warning issued by HKO

- Since 2000, the HKO has been issuing the [Very Hot Weather Warning \(VHWW\)](#) to alert the public to the risk of heat stroke and sunburn in very hot weather, and to advise the public on relevant precautionary measures. It is also adopted as a criterion for opening of temporary heat shelters for needed people and exemption of motor vehicle idling with engine on.
- Over the years, based on collaborative heat health studies with partners, the VHWW and related advisory services/precautions have been enhanced in phases to cope with the public needs and the increasingly hot climate, including prolonged heat and extremely hot conditions.

Hong Kong Heat Index	Heat Stress at Work Warning	Warning Signs
#30 to <32	Amber	
	Amber Heat Stress at Work Warning indicates the level of heat stress in certain work environments is high.	
32 to <34	Red	
	Red Heat Stress at Work Warning indicates the level of heat stress in certain work environments is very high.	
≥34	Black	
	Black Heat Stress at Work Warning indicates the level of heat stress in certain work environments is extremely high.	

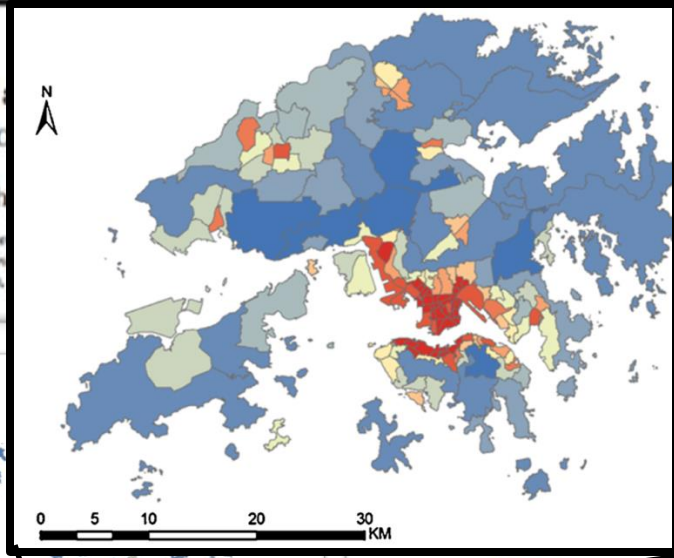

When the Hong Kong Observatory issues “Extremely Hot” Special Alert, the Labour Department issues “Amber” Heat Stress at Work Warning even if the HKHI has not reached 30.

Heat Hazard

Heat Exposure

Heat Vulnerability

Heat Risk

- This study developed a **spatiotemporal hazard-exposure-vulnerability assessment of the extreme heat risk in Hong Kong** integrating cumulative very hot day hours and hot night hours in summer, population density and a principal component analysis (PCA) of demo-socioeconomic characteristics.
- The risk was found **spatially variant**, and high-risk spots were identified at the community scale for both daytime and nighttime with underlying determinants behind.

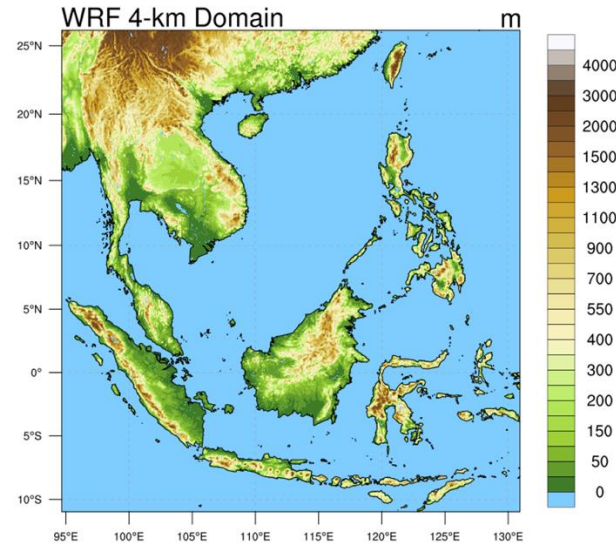

- In both the daytime and the nighttime, high risk mainly occurred in the **core urban areas**.
- This study would be a useful reference for community-scale heat risk assessment and mitigation for the development of healthy and sustainable high-density cities.
